Warren

I spoke with Robert Sherman and Tommy Evans concerning (b) (6) house. It appears that the basement has been testing using the Ludlum, PIC, and wipe samples. It was elevated for gamma. It is about twice as high as the upstairs rooms. We had another house that had a basement in Homestake. It add elevated gamma readings as compared to the upstairs room. (20 in the basement and approx. 4 in the upstairs) So we have a good case that the (b) (6) will be elevated. We still need the radon readings. I can set up the new TDD. Robert thinks that \$5,000 should take of the property.

We have a house in Mesita that is owned by (b) (6). He was a miner at Jackpile for 14 years and about 1 year at Homestake. He brought a truck load of rock home from the mine. This material was used in the construction of the house. It is part traditional house and part wood frame. We have signed up to an access agreement. We found about 5 pieces of petrified rock that is hot. We are going to RAT the house next week. Should we go ahead do the PHASE 2 now? If so should we rent a PIC or see if Gary will bring one out for a day. The homeowner has a persistent cough that he is concerned that the house maybe causing. Please let me know what you think.
